# 1. Project Information

### 1.1 Project Information

- Team Members & contributions:
  - Zining Wang: Idea, Design,
     Implementation and Presentation
- Used Language: elm-lang
- Source Code: https://github.com/ wznmickey/visualizeMe
- Online Demo: https://wznmickey.github.io/visualizeMe/
- Data Source:
  - https://www.kaggle.com/datasets/michael
     bryantds/cpu-and-gpu-product-data
  - https://llm-stats.com/

Current Appearance

In today's fast-paced technological world, advancements in hardware and artificial intelligence (AI) are occurring at breakneck speed. This creates a dilemma for consumers and professionals who seek to stay up-to-date with the best performing systems without breaking the bank. While tools for benchmarking hardware, particularly CPUs and GPUs, have become increasingly sophisticated, the problem lies in the fact that top-tier performance is not necessarily the most cost-effective solution for everyone.

When selecting hardware, it's important to recognize that performance should not be the only consideration. Several other factors play a crucial role in choosing the right setup for a given application.

- Power Consumption: While higher performance often correlates with higher power requirements, a balance must be struck to avoid excessive energy costs or hardware overheating.
- Price: The most powerful hardware often comes with a premium price tag, but for many users, the best performance is not required for their daily tasks. For example, a developer or gamer may need just enough GPU power to run programs efficiently, but not necessarily the highest-end models available.

- Specific Use Case: Different use cases demand different hardware characteristics.
  - Single-core performance might be essential for applications that rely heavily on sequential processing (e.g., certain older games or single-threaded applications).
  - Multi-core performance is critical for tasks like rendering, scientific computing, and modern gaming where parallel processing is leveraged.
  - For GPUs, some users prioritize high encoding and decoding ability for video production, while others might prefer high memory bandwidth for tasks such as gaming, machine learning, or 3D rendering.

In addition to hardware considerations, there are also other contexts in which performance must be evaluated. For instance, in the realm of Large Language Models (LLMs) and other AI models, the user's needs must be balanced across several dimensions. As LLMs continue to evolve, model size, accuracy, and processing speed are important factors to weigh. Some users may prioritize faster inference times, while others may be more concerned with the accuracy of the results. Additionally, some may be restricted by computational resources, thus requiring smaller models that can still offer competitive performance.

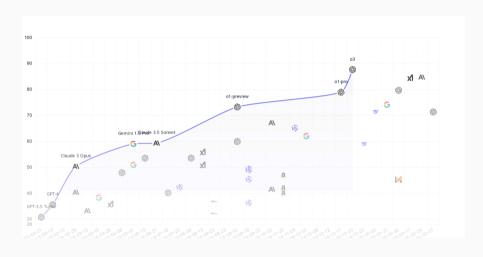

#### 1.3 Current Situation

Hard to filter the desired parameters.

https://socpk.com/allperf/

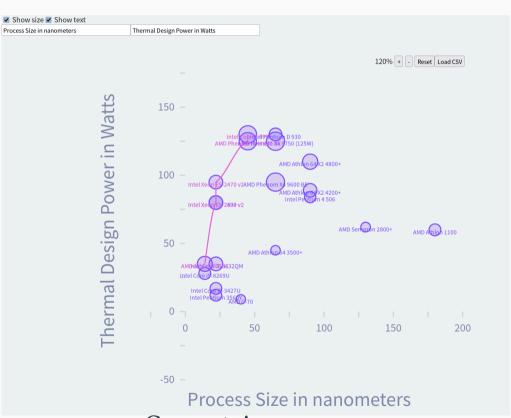

https://llm-stats.com/

# 2. Develop Process

### 2.1 Developed Part

To make the tool acessible to more people, I want to develop a web-based tool and I use elm-lang which is a functional programming language that could be compiled into a static HTML file with JavaScript containing SVG images which could be easily hosted on GitHub Pages service.

Current Appearance

### 2.2 Live Example

https://wznmickey.github.io/visualizeMe/

- 1. Zoom in and out by pressing the button.
- 2. Reset the zoom by pressing the button.
- 3. Zoom in and out by the wheel. (Thanks to the suggestion that using the wheel to zoom in my proposal)
- 4. Move the plot by clicking the new center.
- 5. Drag the plot to move it. (Thanks to the suggestion that removing the + line at the center of the screen in my proposal)
- 6. Switch on the text, size and the pareto line.
- 7. Upload the data and visualize it.
- 8. Change the x-axis, y-axis text.

### 2.3 Current bugs & Undeveloped Part

#### There are some bugs in the current version:

- The text would not disappear when it is out of the screen.
- The size of each point could not resize according to the relative size of the data.
- Text may of x-axis and y-axis may be overlapped by the data point features.

#### To-do:

- Filter different data columns in the csv file.
- Better design of the layout of the page.

# **Developed For**

computer DIY players

LLM local deployment users & researchers

People who have many options to choose from

41
42
    == Motivation
43
    In today's fast-paced technological world, advancements in hardware and artificial intelligence (AI) are occurring at breakneck speed. This creates a dilemma for consumers and professionals
44 who seek to stay up-to-date with the best performing systems without breaking the bank. While tools for benchmarking hardware, particularly CPUs and GPUs, have become increasingly
    sophisticated, the problem lies in the fact that top-tier performance is not necessarily the most cost-effective solution for everyone.
45
    When selecting hardware, it's important to recognize that performance should not be the only consideration. Several other factors play a crucial role in choosing the right setup for a given
    application.
47 #pagebreak()
    - Power Consumption: While higher performance often correlates with higher power requirements, a balance must be struck to avoid excessive energy costs or hardware overheating.
49
     - Price: The most powerful hardware often comes with a premium price tag, but for many users, the best performance is not required for their daily tasks. For example, a developer or gamer may
    need just enough GPU power to run programs efficiently, but not necessarily the highest-end models available.
51 #pagebreak()
    - Specific Use Case: Different use cases demand different hardware characteristics.
      - Single-core performance might be essential for applications that rely heavily on sequential processing (e.g., certain older games or single-threaded applications).
54
55
      - Multi-core performance is critical for tasks like rendering, scientific computing, and modern gaming where parallel processing is leveraged.
56
      - For GPUs, some users prioritize high encoding and decoding ability for video production, while others might prefer high memory bandwidth for tasks such as gaming, machine learning, or 3D
    rendering.
   #pagebreak()
    In addition to hardware considerations, there are also other contexts in which performance must be evaluated. For instance, in the realm of Large Language Models (LLMs) and other AI models,
    the user's needs must be balanced across several dimensions. As LLMs continue to evolve, model size, accuracy, and processing speed are important factors to weigh. Some users may prioritize
    faster inference times, while others may be more concerned with the accuracy of the results. Additionally, some may be restricted by computational resources, thus requiring smaller models
    that can still offer competitive performance.
```

EECE5642 Project Proposal

```
60
61 == Current Situation
    Hard to filter the desired parameters.
   #grid(columns: (1fr, 0.3fr, 1fr))[https://socpk.com/allperf/
      #image("socpk.png", height: 80%)][][
65
      https://llm-stats.com/
66
      #image("LLM.png")
67
68
69
70
   = Develop Process
72
    == Developed Part
    #grid(columns: 2)[
      To make the tool accessible to more people, I want to develop a web-based tool and I use elm-lang which is a functional programming language that could be compiled into a static HTML file
    with JavaScript containing SVG images which could be easily hosted on GitHub Pages service.
76 ][#grid(columns: 1, align: center)[#image("tempResult.png") ][
77
        Current Appearance]]
78
    == Live Example
80
    https://wznmickey.github.io/visualizeMe/
82
83
    1. Zoom in and out by pressing the button.
85 2. Reset the zoom by pressing the button.
   3. Zoom in and out by the wheel. (Thanks to the suggestion that using the wheel to zoom in my proposal)
   4. Move the plot by clicking the new center.
   5. Drag the plot to move it. (Thanks to the suggestion that removing the + line at the center of the screen in my proposal)
   6. Switch on the text, size and the pareto line.
   7. Upload the data and visualize it.
91 8. Change the x-axis, y-axis text.
92
```

EECE5642 Project Proposal

```
93
    == Current bugs & Undeveloped Part
95
    There are some bugs in the current version:
    - The text would not disappear when it is out of the screen.
    - The size of each point could not resize according to the relative size of the data.
    - Text may of x-axis and y-axis may be overlapped by the data point features.
100
101 To-do:
102 - Filter different data columns in the csv file.
      Better design of the layout of the page.
104
